

EXTENDED QCD PHASE DIAGRAM FROM THE LATTICE

F. Cuteri, C. Czaban, O. Philipsen, C. Pinke, A. Sciarra

Goethe University - Frankfurt am Main

University of Giessen - February 1, 2017

[[10.1103/PhysRevD.93.054507](https://arxiv.org/abs/10.1103/PhysRevD.93.054507), [10.1103/PhysRevD.93.114507](https://arxiv.org/abs/10.1103/PhysRevD.93.114507)]

MONTE CARLO METHODS & CUTOFF EFFECTS

$$\mathcal{Z} = \int \mathcal{D}U \prod_{N_f} \det D(\mu_f, m_f; U) e^{-S_G(\beta; U)}, \quad \beta = \frac{2N_c}{g^2}$$

- Importance sampling \leftrightarrow positive Boltzmann weight
- Sign problem for real $\mu \neq 0 \leftrightarrow \det D \in \mathbb{C}$
- Thermodynamical studies with $T = \frac{1}{a(\beta)N_\tau}$
- Thermodynamic and continuum limit at fixed T by $N_\tau, N_\sigma \rightarrow \infty, a \rightarrow 0$

<http://www.jicfus.jp>

$$S_{lat} = S_{cont} + c_1 a + c_2 a^2 + \dots$$

Non-unique discretization: different lattice actions \leftrightarrow different cutoff effects

- Wilson: LO $\mathcal{O}(a)$
 - ▶ local, doublers-free, correct CL
 - ▶ no chiral symmetry
- Staggered: LO $\mathcal{O}(a^2)$
 - ▶ theoretically not fully understood (rooting)
 - ▶ remnants of chiral symmetry

THE SIGN PROBLEM IN LATTICE QCD

OUTLINE

- 1 QCD PHASE DIAGRAM AT REAL AND IMAGINARY μ
- 2 EXTENDED QCD COLUMBIA PLOT ($\mu^2 \neq 0$)
- 3 THE ORDER OF THE THERMAL PHASE TRANSITION
- 4 EXTRAPOLATION FROM IMAGINARY CHEMICAL POTENTIAL
 - Nature of the Roberge-Weiss endpoint at $N_f = 2$
 - Z_2 line in $m_\pi - \left(\frac{\mu}{T}\right)^2$ at $N_f = 2$
- 5 EXTRAPOLATION FROM NON-INTEGER N_f AT $\mu = 0$
 - Z_2 line in $m_{Z_2} - (N_f)$
- 6 OUTLOOK

THE QCD PHASE DIAGRAM AT REAL μ

<http://nica.jinr.ru/>

- PQCD
- Models $\frac{T}{\mu} \ll 1$
- Lattice QCD $\frac{T}{\mu} \gg 1$
- heavy-ion collisions
 - ▶ RHIC-BES
 - ▶ NICA
 - ▶ Nuclotron-M
 - ▶ LHC
 - ▶ FAIR

- Location and order of thermal phase transitions as a function of μ ?
- Existence of a critical endpoint (CEP) at $\mu \neq 0$?

THE QCD PHASE DIAGRAM AT $\mu = i\mu_i$ THE ROBERGE-WEISS SYMMETRY

Roberge and Weiss (1986),
10.1016/0550-3213(86)90582-1

- RW endpoint: true phase transition
- Meeting of RW and chiral/deconfinement phase transitions continued to μ
- Rich phase structure depending on N_f and m_q

$$\mathcal{Z}(\mu) = \mathcal{Z}(-\mu)$$

$$\mathcal{Z}\left(\frac{\mu}{T}\right) = \mathcal{Z}\left(\frac{\mu}{T} + i\frac{2\pi N}{N_c}\right)$$

$$\mu_i^c = (2k + 1)\frac{\pi T}{N_c}, k \in \mathbb{Z}$$

$$|L(\mathbf{n})|e^{-i\varphi} = \frac{1}{3} \text{Tr}_c \left[\prod_{n_0=0}^{N_\tau-1} U_0(n_0, \mathbf{n}) \right]$$

$$\langle \varphi \rangle = \frac{2n\pi}{3} \text{ with } n \in \{0, 1, 2\}$$

$$0 < \mu_i < \frac{\pi}{3}$$

$T - \left(\frac{\mu}{T}\right)^2 - m_{u,d}$ PHASE DIAGRAM

- Coarse lattices
- All β critical at μ_i^c
- 1^{st} order regions extend till $\mu = 0$
 - ▶ $m_{u,d} \rightarrow 0$
 - ▶ $m_{u,d} \rightarrow \infty$
- 2^{nd} order critical masses m_1^c, m_2^c at $\mu = 0$

de Forcrand and Philipsen (2002), [10.1016/S0550-3213\(02\)00626-0](https://doi.org/10.1016/S0550-3213(02)00626-0),
 D'Elia, Lombardo (2003), [10.1103/PhysRevD.67.014505](https://doi.org/10.1103/PhysRevD.67.014505)

OUTLINE

- 1 QCD PHASE DIAGRAM AT REAL AND IMAGINARY μ
- 2 EXTENDED QCD COLUMBIA PLOT ($\mu^2 \neq 0$)
- 3 THE ORDER OF THE THERMAL PHASE TRANSITION

 - Z_2 line in $m_{Z_2} - (N_f)$
- 6 OUTLOOK

2D COLUMBIA PLOT $m_s - m_{u,d}$ AT $\mu = 0$

Dependence of the order of the thermal phase transition on m_q

- Breaking of global $Z(3)$ for $m_{u,d}, m_s \rightarrow \infty$
- Restoration of global $SU_L(N_f) \times SU_R(N_f)$ for $m_{u,d}, m_s \rightarrow 0$

Current knowledge (no CL)

Order parameters

- Polyakov loop for $m_{u,d}, m_s \rightarrow \infty$

$$P = \text{Tr} e^{i \int A_t dt}$$
- Chiral condensate for $m_{u,d}, m_s \rightarrow 0$

$$\bar{\psi}\psi = \partial \log Z / \partial m_{u,d}$$

Svetitsky, Yaffe (1982), [10.1016/0550-3213\(82\)90172-9](https://doi.org/10.1016/0550-3213(82)90172-9)

de Forcrand and Philipsen (2007), [10.1088/1126-6708/2007/01/077](https://doi.org/10.1088/1126-6708/2007/01/077)

2D COLUMBIA PLOT $m_s - m_{u,d}$ AT $\mu = 0$

At least two possible scenarios on the nature of $N_f = 2$ chiral transition

Second order scenario

First order scenario

- Direct (expensive) approach: $\mu = 0$ and $m_{u,d} \rightarrow 0$
- Indirect (cheaper) approach: $\mu = i\mu_i$, bigger $m_{u,d}$ and scaling laws

Svetitsky, Yaffe (1982), [10.1016/0550-3213\(82\)90172-9](https://doi.org/10.1016/0550-3213(82)90172-9)

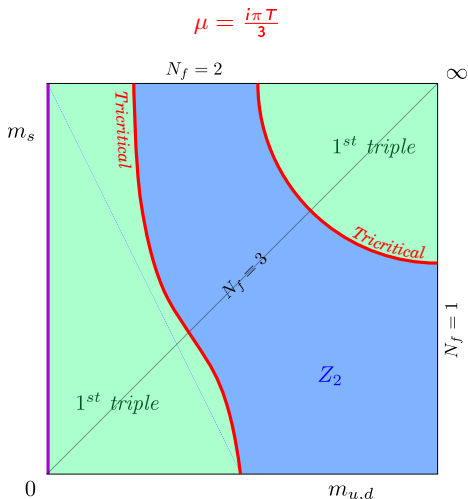

Pisarski, Wilczek (1984), [10.1103/PhysRevD.29.338](https://doi.org/10.1103/PhysRevD.29.338)

Aoki et al. (2006), [10.1038/nature05120](https://doi.org/10.1038/nature05120)

de Forcrand and Philipsen (2007), [10.1088/1126-6708/2007/01/077](https://doi.org/10.1088/1126-6708/2007/01/077)

2D COLUMBIA PLOT $m_s - m_{u,d}$ AT $\mu = \frac{i\pi T}{3}$

Assuming the “first order scenario” is realized

3D COLUMBIA PLOT $\left(\frac{\mu}{T}\right)^2 - m_s - m_{u,d}$

courtesy of A. Sciarra [arXiv:1610.09979](https://arxiv.org/abs/1610.09979)

$\left(\frac{\mu}{T}\right)^2 - m_{u,d}$ COLUMBIA PLOT

courtesy of A. Sciarra [arXiv:1610.09979](https://arxiv.org/abs/1610.09979)

- From m_1^{tric} in RW plane $\mu = i\mu_i = \frac{i\pi T}{3}$
- Send $\mu_i \rightarrow 0$ mapping $\mu_i^Z(m_{u,d})$ (3D Ising)
- Expected tricritical scaling $m_{u,d}^{2/5} = C \left[\left(\frac{\mu}{T}\right)^2 - \left(\frac{\mu}{T}\right)_{tric}^2 \right]$

TOWARDS REAL- μ COLUMBIA PLOT

- Analytical continuation on constraint that no non-analyticity is met
- Existence of 2nd order CEP depending on the bending of the Z_2 surfaces continued from μ_i

OUTLINE

- 1 QCD PHASE DIAGRAM AT REAL AND IMAGINARY μ
- 2 EXTENDED QCD COLUMBIA PLOT ($\mu^2 \neq 0$)
- 3 THE ORDER OF THE THERMAL PHASE TRANSITION
- 4 EXTRAPOLATION FROM IMAGINARY CHEMICAL POTENTIAL
 - Nature of the Roberge-Weiss endpoint at $N_f = 2$
 - Z_2 line in $m_\pi - \left(\frac{\mu}{T}\right)^2$ at $N_f = 2$
- 5 EXTRAPOLATION FROM NON-INTEGER N_f AT $\mu = 0$
 - Z_2 line in $m_{Z_2} - (N_f)$
- 6 OUTLOOK

ESTABLISHING THE ORDER OF THE TRANSITION

- Analysis of the order parameter $\langle \mathcal{O} \rangle$ distribution and its moments

$$B_n(\langle \mathcal{O} \rangle, \beta, m_q, \mu, V) \equiv B_n(\beta, m_q, \mu, N_\sigma) = \frac{\langle (\mathcal{O} - \langle \mathcal{O} \rangle)^n \rangle}{\langle (\mathcal{O} - \langle \mathcal{O} \rangle)^2 \rangle^{n/2}}$$

$$\mathcal{O} = L_{\text{Im}}, \bar{\psi}\psi$$

- $\forall m_q$ identify β_c by $\begin{cases} \text{the condition } B_3(\beta, m_q, \mu, N_\sigma) = 0 \forall N_\sigma; \\ \text{the crossing of } B_4(\beta, m_q, \mu, N_\sigma) \text{ for different } N_\sigma. \end{cases}$
- $B_4(\beta_{(c)}, m_q, \mu, N_\sigma)$ gives the order of the transition as function of β, m_q or μ

$$B_4(\beta_{(c)}, m_q, \mu, N_\sigma) = \left. \frac{\langle (\mathcal{O} - \langle \mathcal{O} \rangle)^4 \rangle}{\langle (\mathcal{O} - \langle \mathcal{O} \rangle)^2 \rangle^2} \right|_{\beta_c} \underset{V \rightarrow \infty}{\sim} \begin{cases} 1, & 1^{\text{st}} \text{ order;} \\ 1.604, & 2^{\text{nd}} \text{ order } Z_2; \\ 3, & \text{crossover.} \end{cases}$$

FINITE SIZE SCALING (FSS) ANALYSIS

Critical exponent ν by either fit or quantitative collapse

— V_1 — $V_2 > V_1$ — $V_3 > V_2 > V_1$ — $V = \infty$

$$B_4(X, N_\sigma) = B_4(X_c, \infty) + a_1 x + a_2 x^2 + \mathcal{O}(x^3)$$

$$x \equiv (X - X_c) N_\sigma^{1/\nu}, \quad X = \beta, m, \frac{\mu_i}{T}$$

OUTLINE

$N_\tau = 4$ ◆ $N_\tau = 6$ ◆ $N_\tau = 8$ ◆ $N_\tau = 4$ ■
 ↪ staggered

$$m_\pi^{\text{tricr. heavy}} = 3659_{-619}^{+589} \text{ MeV}, \quad m_\pi^{\text{tricr. light}} = 669_{-81}^{+95} \text{ MeV}$$

$$0.12 \text{ fm} \lesssim a \lesssim 0.18 \text{ fm}$$

ROBERGE-WEISS TRANSITION IN $N_f = 2$ QCD

(Unimproved) Wilson fermions on $N_\tau = 4, 6$ [[10.1103/PhysRevD.93.054507](#)]

Pinke, Philipsen (2014), [10.1103/PhysRevD.89.094504](#), F.C. et al (2015), [10.1103/PhysRevD.93.054507](#)

Bonati et al. (2011), [10.1103/PhysRevD.83.054505](#)

$N_\tau = 4$  $N_\tau = 6$  $N_\tau = 8$  $N_\tau = 4$ 
↳ staggered

- Tension between results for different discretizations (Wilson, staggered)
- Need larger N_τ to attain continuum limit

ROBERGE-WEISS TRANSITION IN $N_f = 2$ QCD

(Unimproved) Staggered fermions on $N_\tau = 6$ [Philipsen and Sciarra [arXiv:1610.09979](https://arxiv.org/abs/1610.09979)]

- Simulations ongoing
- Waiting for pion mass measurement
- Shift wrt $N_\tau = 4$ (d'Elia, Sanfilippo (2009), [10.1103/PhysRevD.80.111501](https://arxiv.org/abs/10.1103/PhysRevD.80.111501)
Bonati et al. (2011), [10.1103/PhysRevD.83.054505](https://arxiv.org/abs/10.1103/PhysRevD.83.054505))

Z_2 CRITICAL LINE IN $m_\pi - \left(\frac{\mu}{T}\right)^2$ IN $N_f = 2$ QCD

(Unimproved) Wilson fermions on $N_\tau = 4$ [10.1103/PhysRevD.93.114507]

- Starting point m_1^{tric} at $N_\tau = 4$ (Pinke, Philipsen (2014), 10.1103/PhysRevD.89.094504)

$$\mathcal{O} = \bar{\psi}\psi = N_f \text{Tr} D^{-1}$$

$$T = \frac{1}{a(\beta) N_\tau} \rightarrow a\mu_i = \frac{\pi}{3N_\tau}$$

$$\kappa = \frac{1}{2(am + 4)}$$

$$\text{fixed } \kappa \longleftrightarrow B_4\left(\frac{\mu_i}{T}, N_\sigma\right) = B_4\left(\frac{\mu_i^c}{T}, \infty\right) + a_1 \left[\left(\frac{\mu_i}{T}\right)^2 - \left(\frac{\mu_i^c}{T}\right)^2 \right] N_\sigma^{1/\nu} + \dots$$

$$\text{fixed } \mu = 0 \longleftrightarrow B_4(\kappa, N_\sigma) = B_4(\kappa, \infty) + b_1 \left[\frac{1}{\kappa} - \frac{1}{\kappa_c} \right] N_\sigma^{1/\nu} + \dots$$

DIFFERENT DISCRETIZATIONS COMPARED

$$a \gtrsim 0.25 \text{ fm}$$

$$\kappa_c(\mu = 0) = 0.1815(1)$$

$$m_\pi^c(\mu = 0) \approx 560 \text{ MeV}$$

- Wilson $\mathcal{O}(a)$ improved results from Burger et al. (2013), [10.1103/PhysRevD.87.074508](https://arxiv.org/abs/10.1103/PhysRevD.87.074508) (Twisted Mass) and Brandt et al. (2014), [arXiv:1310.8326](https://arxiv.org/abs/1310.8326) (clover)
- No need for extrapolation using tricritical scaling law
- Only qualitative agreement between different discretizations (cf. staggered Bonati et al. (2014), [10.1103/PhysRevD.90.074030](https://arxiv.org/abs/10.1103/PhysRevD.90.074030))
- Expected shift of $\mu_i^{Z_2}(m_{u,d})$ to smaller $m_{u,d}$ as $a \rightarrow 0$

- Statistics \longrightarrow $\sim (200k - 400k)$ per β

CHECKING THE ORDER OF THE TRANSITION...

- Chiral condensate $\langle \bar{\psi}\psi \rangle$ and moments of its distribution

$$B_n(\langle \bar{\psi}\psi \rangle, \beta, m, V) \equiv B_n(\beta, m, N_\sigma) = \frac{\langle (\bar{\psi}\psi - \langle \bar{\psi}\psi \rangle)^n \rangle}{\langle (\bar{\psi}\psi - \langle \bar{\psi}\psi \rangle)^2 \rangle^{n/2}}$$

CHECKING THE ORDER OF THE TRANSITION...

- Chiral condensate $\langle \bar{\psi}\psi \rangle$ and moments of its distribution

$$B_n(\langle \bar{\psi}\psi \rangle, \beta, m, V) \equiv B_n(\beta, m, N_\sigma) = \frac{\langle (\bar{\psi}\psi - \langle \bar{\psi}\psi \rangle)^n \rangle}{\langle (\bar{\psi}\psi - \langle \bar{\psi}\psi \rangle)^2 \rangle^{n/2}}$$

- $\forall m, N_\sigma$ identify β_c by the condition $B_3(\beta, m, N_\sigma) = 0$

CHECKING THE ORDER OF THE TRANSITION...

- Chiral condensate $\langle \bar{\psi}\psi \rangle$ and moments of its distribution

$$B_n(\langle \bar{\psi}\psi \rangle, \beta, m, V) \equiv B_n(\beta, m, N_\sigma) = \frac{\langle (\bar{\psi}\psi - \langle \bar{\psi}\psi \rangle)^n \rangle}{\langle (\bar{\psi}\psi - \langle \bar{\psi}\psi \rangle)^2 \rangle^{n/2}}$$

- $\forall m, N_\sigma$ identify β_c by the condition $B_3(\beta, m, N_\sigma) = 0$

CHECKING THE ORDER OF THE TRANSITION...

- Chiral condensate $\langle \bar{\psi}\psi \rangle$ and moments of its distribution

$$B_n(\langle \bar{\psi}\psi \rangle, \beta, m, V) \equiv B_n(\beta, m, N_\sigma) = \frac{\langle (\bar{\psi}\psi - \langle \bar{\psi}\psi \rangle)^n \rangle}{\langle (\bar{\psi}\psi - \langle \bar{\psi}\psi \rangle)^2 \rangle^{n/2}}$$

- $\forall m, N_\sigma$ identify β_c by the condition $B_3(\beta, m, N_\sigma) = 0$
- $B_4(\beta_c, m, N_\sigma)$ to extract the order of the transition as function of m

$$B_4(\beta_c, m, N_\sigma) = \frac{\langle (\bar{\psi}\psi - \langle \bar{\psi}\psi \rangle)^4 \rangle}{\langle (\bar{\psi}\psi - \langle \bar{\psi}\psi \rangle)^2 \rangle^2} \Bigg|_{\beta_c} \underset{V \rightarrow \infty}{\sim} \begin{cases} 1, & 1^{\text{st}} \text{ order;} \\ 1.604, & 2^{\text{nd}} \text{ order } Z_2; \\ 3, & \text{crossover.} \end{cases}$$

...AND LOCATING $m_{Z_2}(N_f)$

Fitting $B_4(\beta_c, m, N_\sigma)$ at fixed N_f and various N_σ , as function of m

$$B_4(\beta_c, m, N_\sigma) = B_4(\beta_c, m_{Z_2}, \infty) + a(m - m_{Z_2})N_\sigma^{1/\nu} + \dots$$

$$B_4(\beta_c, m_{Z_2}, \infty) = 1.604$$

$$a = 0.59(5)$$

$$\nu = 0.6301$$

$$m_{Z_2} = 0.0211(3)$$

$$\chi_{ndf=10}^2 = 0.27$$

HOW (WIDE) SMALL IS THE TRICRITICAL SCALING REGION IN $m_{Z_2}(N_f)$?

HOW (WIDE) SMALL IS THE TRICRITICAL SCALING REGION IN $m_{Z_2}(N_f)$?

de Forcrand and Philipsen (2003), [10.1016/j.nuclphysb.2003.09.005](https://arxiv.org/abs/10.1016/j.nuclphysb.2003.09.005)

HOW (WIDE) SMALL IS THE TRICRITICAL SCALING REGION IN $m_{Z_2}(N_f)$?

de Forcrand and Philipsen (2003), [10.1016/j.nuclphysb.2003.09.005](https://arxiv.org/abs/10.1016/j.nuclphysb.2003.09.005)

Bonati et al. (2014), [10.1103/PhysRevD.90.074030](https://arxiv.org/abs/10.1103/PhysRevD.90.074030)

HOW (WIDE) SMALL IS THE TRICRITICAL SCALING REGION IN $m_{Z_2}(N_f)$?

$$m_{Z_2}^{2/5}(N_f) = C (N_f - N_f^{tric})$$

$N_f = 2.2 \in$ TRICRITICAL SCALING REGION?

$$m_{Z_2}^{2/5}(N_f) = C (N_f - N_f^{tric})$$

$$\chi_{ndf=1}^2 = 0.28$$

$N_f = 2.2 \in$ TRICRITICAL SCALING REGION?

- Assuming that the tricritical scaling sets in at $N_f = 2.2$
 - ▶ Same scaling window in m as found in the extrapolation from μ_i
 - ▶ $N_f^{tric} = 1.75(32)$
- Waiting for ongoing simulations at $N_f = 2.0...$

OUTLINE

- 1 QCD PHASE DIAGRAM AT REAL AND IMAGINARY μ
- 2 EXTENDED QCD COLUMBIA PLOT ($\mu^2 \neq 0$)
- 3 THE ORDER OF THE THERMAL PHASE TRANSITION
- 4 EXTRAPOLATION FROM IMAGINARY CHEMICAL POTENTIAL
 - Nature of the Roberge-Weiss endpoint at $N_f = 2$
 - Z_2 line in $m_\pi - \left(\frac{\mu}{T}\right)^2$ at $N_f = 2$
- 5 EXTRAPOLATION FROM NON-INTEGER N_f AT $\mu = 0$
 - Z_2 line in $m_{Z_2} - (N_f)$
- 6 OUTLOOK

OUTLOOK

- First investigation
 - ▶ Just entered the scaling region...
 - ▶ Coarse $N_\tau = 4$ lattices explored
 - ▶ Rooted staggered fermion discretization: cross check needed
- Theoretical caveat: at non-integer N_f our theory lacks locality and does NOT correspond to a well defined QFT in the CL
- Theoretical caveat: ∞ many interpolations between $N_f = 2$ and $N_f = 3$
 $\lim_{N_f \rightarrow 2,3} \mathcal{Z}(N_f = 2.\#) = \mathcal{Z}(N_f = 2, 3)$
- However
 - ▶ the relative position of N_f^{tric} w.r.t. $N_f = 2$ has to be uniquely determined by every interpolation
 - ▶ possible matching among interpolations
- In view of a continuum limit: the width of scaling regions fixed in physical units will shrink in lattice units
 - ▶ Which extrapolation is more expensive?
 - ★ from imaginary chemical potential μ_i at $N_f = 2$
 - ★ from non-integer N_f at $\mu = 0$
 - ★ from $N_f = 2 + 1$ while increasing m_s at $\mu = 0$

THANK YOU!
